Leveraging Large Language Model Prompting for Rapid High-Level Synthesis Kernel Optimization

The fields of Deep Learning and Natural Language Processing (NLP) have experienced significant advancements, particularly with the emergence of Large Language Models (LLMs) like Generative Pre-trained Transformers (GPT) [1]. LLMs are deep learning models with a large number of learnable parameters, trained on extensive text datasets, enabling them to excel in a wide range of natural language understanding and generation tasks with remarkable accuracy. These models have also been adopted for computer-related language tasks, such as GitHub's Copilot [2], which provides autocomplete-style coding suggestions, and Microsoft's Codebert, a versatile model for feature extraction that can be fine-tuned for various programming language tasks [3].

The rapid adoption of LLMs for source-code analysis and software development tasks presents a promising opportunity for their application in more domain-specific contexts. In particular, within FPGA programming using higher-level languages like High-Level Synthesis (HLS), this shift offers a way to harness LLMs to increase design abstraction and reduce the complexities of hardware development. By providing real-time insights and guidance as developers code, LLMs enable on-the-fly assessment and optimization of HLS applications [4].

In this diploma thesis, you will use a GPT e.g., ChatGPT to automatically optimize kernels using High-Level Synthesis directives. You will try to induce domain specific knowledge on the LLM e.g using the RAG architecture [5] to guide it towards an optimal solution. The user will acquire knowledge on the way you generally guide pre-trained model to give you the expected answer. Besides the LLM-based concepts the user will be able to familiarize with Vitis [6] the SotA framework for designing kernels using HLS on AMD FPGAs.

PREREQUISITES

Strong knowledge of **Python** and **Bash Scripting**

Desirable: Familiarity with **High Level Synthesis**, **Machine Learning**, and **LLM Prompting**
